This year I felt the gearing configuration of this tractor should be reevaluated. I discovered there was a way of slowing this tractor down even more, and it now travels at One Foot 12 inches per hour in the lowest gear. The story follows:. One or the other was used in conjunction with the standard production transmission. This tractor was constructed to show the effects that each transmission has on the operation of the tractor. In the configuration used on this tractor it has 32 forward and 6 reverse speeds. In the lowest gear it travels one foot, 12 inches per hour. Below are listed the transmission and speed reduction units used in conjunction with the four speed transmission which was standard on the Ford 8-N tractor. It is mounted in front of the standard transmission. The shift handle is on the left side of the tractor, below the steering gear box. This two-speed reduction transmission was used when a trencher was mounted on the tractor. It has a 96 to 1 gear reduction to produce the slow speed needed to operate a trenching machine attachment. The shift handle is located on top on the gear reduction unit directly in front of the seat. This two-speed transmission has a 3. Howard Rotary Hoe Ltd made this unit in England. It uses a planetary gear system and is normally mounted directly to the rear of the standard transmission. In this tractor it is mounted to the rear of the Everett trencher transmission. The shift handle extends out on the right side of the differential housing. This tractor was constructed over a three-year period of time. After the idea was conceived to construct this tractor, a nationwide advertising search began for the various units needed to complete this project. The Everett unit was located in Ohio. The most rare of all and most difficult to locate was the Howard unit, which was located in Connecticut. The loader has a lift capacity of pounds. The fork is controlled by means of a manual trip and automatically returns to the

locked position when dumped. I have covered the ends of the tines on the bucket for safety reasons when this implement is on display. The loader is designed especially for the Ford Tractor and can easily be attached without the use of special tools. John Deere and use their dealer locator to identify the closest dealer to you. Enjoy reading N-News online? Subscribe today to receive all of the essential N-News. By John Cuny. I grew up in southern California when it was bean fields, before it all became Disney Land. As a year-old, I worked as a gas boy for the local seaplane company that made daily flights to Catalina Island. I was around airplanes and tugs all the time. This experience was the impetus to become a pilot. I worked for American for 30 years, retiring in after being a captain on s and s. I acquired the old Ford 8N to help around my properties. A friend in Texas had told me about a pastor in Oklahoma who was dying of cancer and had a Ford 8N to sell. I went to go see him. He just wanted to make sure the Ford went to someone who was going to take care of it. I purchased the tractor, a bunch of implements and a trailer and brought it all back to Texas. This was I had a few pieces of property by then. One was a horse property and the box blade was good for the driveway and the fields. Another place had lots of trees and shrubs, so the brush hog was great for that. And when not used for hard work, it was a great tug for my Republic Seabee four seater airplane. The 8N has been with me for 35 years. It has been a solid worker the whole time asking very little of me. After retiring and selling my property in Texas, I moved to the northwest. The 8N got a full restoration in the late s and is now only used as a tug. I used the N-News to help with parts for the rebuild. I still love flying and I love the way a seaplane could get me off the beaten track. The plane got re-powered with a Lycoming hp supercharged engine. The original engine was a Franklin hp. Originally the plane had a lb payload and a mile range. I upgraded fuel cells and basic instruments. The plane also got a 3-bladed, pitched-controlled unit, disk brakes, new glass and reinforced flooring in the cargo section. By Robert Pripps. The company struggled and failed to gain government contracts for fighter plane designs until when investors took over the company and renamed it Republic Aviation Corporation, which then went on to develop, on its own money, the XPB Thunderbolt. This aircraft became the most produced U. The only civilian product by Republic was the innovative SeaBee 4-place Amphibian introduced in The SeaBee was not a success. Only planes were produced from I bought my from a farm auction in the spring of The tractor is unrestored. I like the dings and faded paint â€" it gives it character. I rebuilt a tandem axle trailer and built a set of forks for the 3-point hitch. I bought my 8N as a partially dis-assembled unit almost 30 years ago. A man about five miles away had the 8N sitting along the road for sale and we made a deal. Tractors were part of the fabric of the community in Lonoke, Arkansas, a small farming community of about 4, people. A friend told me about a fifteen years ago â€" a propane model. And nothing was easy on this restoration which took place over twelve years. Unless there is a son or daughter who is interested in your tractor, there comes a time when you need to send it on to the next owner. The other story picks up the first left off: an 8N ready for a new life with a new family. When I began considering

taking on the challenge of restoring one, my memories of the Ford 8N I drove as a teenager were vivid and influenced my decision. There was no need for me to travel across the country to find one. I found mine within 45 miles of home. My dad said that I needed a tractor to maintain the place, so we started the search and soon found a mechanically restored NAA Golden Jubilee painted all one color. We pooled our money and bought it. My father announced that he was buying a tractor. He brought us over to this giant, rusty piece of iron with cracked rubber tires and declared that we were taking this beast back to Brooklyn with us. We made it home without a hitch and for years my father tinkered and toyed with the tractor until he had fully restored it. Nearly twenty years after inheriting the tractor, I finally understand. I now have an appreciation for things from the past that move more slowly. My wife and I decided to move out of the suburbs and build a house on the old family farm in central Indiana. I asked my uncle whether I could get by with an overgrown lawn and garden tractor or if I needed something bigger. As I degreased and lightly sanded the frame, I found the serial number â€" 8N When I was about twelve years old, I learned to drive the tractors. Last winter, I restored the NAA. I hope it will continue to provide reliable service for the next generation. Fifty-five years later I tried to locate our original family tractor. So I gave up looking and searched for an 8N and located one in the State of Arkansas. A restoration process was immediately started to return the tractor to its condition as delivered from the factory in The careful use of money, especially by avoiding waste. Makin

 g due with what is available is paramount these days. I needed a good dry place to keep my tractor and set to making that thought a reality at the farmhouse where I grew up. So I built a lean-to style pole barn off the end of the house recently and did the whole project for around ten dollars. My dad, Bill Wells, had a desk job in the Boston financial district. Then in , mom and dad bought an old dairy farm in Massachusetts. But dad was not interested in dairy barn hook ups â€" he wanted to raise poultry! And we needed a tractor. Dad found a used 9N and a new farm trailer. It was on the N that I had my first driving lesson at age eleven! When he retired, he moved to a family farm in New Hampshire and another 8N took over the mowing work. By Larry Gorbet. N-News Winter N-News Autumn By Ralph Brown.
